Get this from a library! Computer programming for graphical displays. [Daniel L Ryan]set of graphical displays. Polaris builds tables using an algebraic formalism involving the fields of the database. Each table consists of layers and panes and each pane may contain a different graphic. The use of tables to organize multiple graphs on a display is a technique often used by statisticians in their analysis of data [5], [11], [38]. The Polaris interface is simple and expressive ...This book present graphical methods for analysing data. Some methods are new and some are old, some require a computer and others only paper and pencil; but they are all powerful data analysis tools.For typical computer displays, three-dimensional is a misnomer—their displays are two-dimensional. Semantically, however, most graphical user interfaces use three dimensions. With height and width, they offer a third dimension of layering or stacking screen elements over one another. This may be represented visually on screen through an illusionary transparent effect, which offers the advantage that information in background windows may still be read, if not interacted with. Or the ...
