This paper reports not on the results of two sets of experimental burials of juvenile pig corpses in raised bog peat, but on the lessons learned from the research in terms of methodology and validity of this type of research for the interpretation of PharmaCircle is an innovative knowledge management company specializing in the drug delivery, pharmaceutical and biotechnology fields. The current clients of PharmaCircle™ vary from world leaders to start up companies in the pharmaceutical, biotechnology and drug delivery fields. In general, polymers with a R₂SiO unit are termed silicones, while the SiO repeat unit is also called siloxane. The strength of the SiO bond gives the polymer its thermal and chemical stability, which is important for its use in high-temperature applications [1,2]. Most proteins consist of linear polymers built from series of up to 20 different L- α -amino acids. All proteinogenic amino acids possess common structural features, including an α -carbon to which an amino group, a carboxyl group, and a variable side chain are bonded.
