

# Download Life Cycle Of The Whale

The life cycle of dolphins is similar to that of land mammals. Some species of dolphin appear to be only fertile for a short period every few years and typically produce offspring every 1 1/2 – 3 years. A whale louse is a commensal crustacean of the family Cyamidae. Despite the name, they are not true lice (which are insects), but rather are related to the better-known skeleton shrimp, most species of which are found in shallower waters. Have a whale of a time Discover a world of whales at the SA Whale Centre. Delve into our cellar of secrets and immerse yourself in an underwater world where whales line the walls. At 94 feet long, this model of a blue whale is a Museum treasure. Meet the largest animal ever known to have existed.
